Objective

Results-driven Software Developer with 3+ years of experience in **Spring boot**, **React JS**, and **SQL**, specializing in performance optimization and cybersecurity. Skilled in solving complex problems and leading projects to success. Looking to leverage my technical expertise to drive innovation and deliver impactful software solutions in a dynamic environment.

Skills

Languages: Java, JavaScript, SQL, HTML, CSS

Technologies: SpringBoot, React.js, Node.js, SQL

Soft Skills: Problem-Solving, Adaptability, Collaborative, Leadership

Experience

Member Technical Staff

June 2021 - Present

Zoho Corp Pvt Ltd.

Tamil Nadu, India

- Introduced URL Monitoring for OpManager MSP Edition to monitor the response time, availability, and reachability of websites managed by enterprises using HTTPClient jar, improving overall monitoring efficiency.
- Developed Hardware Monitoring for 25 major vendors**, enabling the monitoring of hardware sensors such as fan speed, temperature, and power supplies in network devices like switches, routers, and firewalls using SNMP, IPMI, and WMI protocols. This resulted in proactive alerts for customers if any device malfunctioned or exceeded thresholds.
- Optimized the performance of the URL Monitors page by loading data through a single SQL query, rather than retrieving the uptime for each URL separately, resulting in a significant **reduction in load times by 95%**.
- Implemented alerts for memory and CPU utilization of customer devices, including the top three high utilization processes and detailed memory and CPU usage for all active processes, enhancing system visibility and performance monitoring.
- Passionate about Cybersecurity, actively identified and fixed security vulnerabilities, including SQL Injections, XSS, and RCEs, through rigorous testing and analysis of our product. This proactive approach enhanced the product's security posture and **reduced potential security risks by 30%**.
- Enhanced the product to use one session only while collecting the data from IPMI RestAPIs to monitor Hardwares of the devices instead of initiating more number of sessions each time. This **reduced the number of load to the devices by 40%**.
- Optimized IPMI monitoring performance by maintaining a single session throughout data collection, rather than creating multiple sessions for each request. This enhancement reduced the load on monitored devices by **80%**, **improving efficiency and system stability**.
- Resolved customer issues promptly by addressing their requirements and fixing raised issues, **improving customer satisfaction and response times by 60%**.

Education

Karunya Institute of Technology and Science

Bachelor of Technology in Computer Science

Tamil Nadu, India

June 2017 - May 2021

Achievements

- Received commendation from a major customer for **enhancing product performance by 95%** and significantly strengthening its security posture.
- Contributed to a significant increase in APM plugin valid installations by enhancing the connection stability between both products, resulting in a **70% growth in deployment and customer satisfaction**.
- Engineered a hot swap feature for VS Code, enabling team members to run Java files without restarting the product, thereby streamlining the development process and boosting productivity.
- Developed a simulator using JavaScript to emulate the response of IPMI Redfish APIs, enabling seamless integration of new vendors into the IPMI framework and significantly reducing testing efforts.
